July 13th, 2009

Dear Valued Customer,

Tools For Trades and RockSteady™, LLC have joined together to provide information regarding the newest stabilizing clip, the RockSteady™ Clip.

We believe this new drywall stabilizing system is an important and cost effective safety advance for the drywall industry. A majority of suppliers deliver drywall to a construction site and store it vertically (on edge), while others deliver and store it flat on the floor. On a construction site, unsecured, vertically stacked drywall is a known hazard. A typical stack weighs more than two thousand pounds and if allowed to become unstable, can cause serious injury and even death. Storing drywall flat will keep it from falling, but it exposes the delivery person and drywall installer to a higher risk for acute and cumulative back injuries. Employers are required to provide a safe work environment and contractors are required to maintain a safe construction site. The delivery person is able to stack the drywall vertically and stabilize it with the RockSteady™ Clip and the installer can lift material from waist height rather than floor level.

By stabilizing drywall stacked on edge, the RockSteady™ Clip eliminates the need to choose between worker health and safety or construction site safety when stocking and storing drywall.

There are additional benefits to using the RockSteady™ Clip. Storing material vertically eliminates a tripping hazard and allows drywall to be stored in spaces too small to be placed on the floor. The RockSteady™ Clip is designed to be removed with a tool, making it unlikely to be removed by a jobsite visitor. The fluorescent label on each RockSteady™ Clip, serves as a warning to those who may be unaware of the danger of heavy drywall. Consistent best practices in drywall hanging result in lower direct and indirect costs to employers from injuries and accidents on the jobsite.

The RockSteady™ Clip is a patented, cost effective drywall stabilizing system. When used according to the Installation Instructions, the RockSteady™ Clip virtually eliminates the incidental/accidental tip-over of vertically stacked drywall. It is manufactured and assembled entirely in the U.S.A.
